The human body is a biological machine made of body systems; groups of organs that work together to produce and sustain life. Sometimes we get lost while studying about cells and molecules and can't see the forest for the trees. It can be helpful to step back and look at the bigger anatomical picture. The human body is a complex, highly organized structure made up of unique cells that work together to accomplish the specific functions necessary for sustaining life. The biology of the human body includes Physiology (how the body functions) Anatomy (how the body is structured) Anatomy is organized by levels, from the smallest components of cells to the largest organs and their relationships to other organs. Gross anatomy is the study of the body's organs as seen with the naked eye during visual inspection and when the body is cut open for examination (dissection). Cellular anatomy is the study of cells and their components, which can be observed only with the use of special techniques and special instruments such as microscopes. Molecular anatomy (often called molecular biology) is the study of the smallest components of cells at the biochemical level. The human body is a complex and intricate piece of engineering in which every structure plays a precise role. There are approximately 200 bones, 650 muscles, 79 organs, and enough blood vessels to circle the Earth twice! Anatomy and physiology change remarkably between fertilization and birth. After birth, the rate of anatomic and physiologic changes slows, but childhood is still a time of remarkable growth and development. Some anatomic changes occur past adulthood, but the physiologic changes in the body's cells and organs are what contribute most to what we experience as aging Our bodies consist of a number of biological systems that carry out specific functions necessary for everyday living. The job of the circulatory system is to move blood, nutrients, oxygen, carbon dioxide, and hormones, around the body. It consists of the heart, blood, blood vessels, arteries and veins. The digestive system consists of a series of connected organs that together, allow the body to break down and absorb food, and remove waste. It includes the mouth, esophagus, stomach, small intestine, large intestine, rectum, and anus. The liver and pancreas also play a role in the digestive system because they produce digestive juices. The endocrine system consists of eight major glands that secrete hormones into the blood. These hormones, in turn, travel to different tissues and regulate various bodily functions, such as metabolism, growth and sexual function. The immune system is the body's defense against bacteria, viruses and other pathogens that may be harmful. It includes lymph nodes, the spleen, bone marrow, lymphocytes (including B-cells and T-cells), the thymus and leukocytes, which are white blood cells. The lymphatic system includes lymph nodes, lymph ducts and lymph vessels, and also plays a role in the body's defenses. Its main job is to make is to

make and move lymph, a clear fluid that contains white blood cells, which help the body fight infection. The lymphatic system also removes excess lymph fluid from bodily tissues, and returns it to the blood.

Human biology is the science that studies the human body through the lens of anatomy, human genetics and evolution, physiology, immunology, epidemiology and anthropology. It also provides the foundation for a scientific approach to the study of diseases in humans, which involves therapy, diagnosis and prevention. There is a growing body of experimental and clinical data to suggest that the organs of the digestive system may be subjected to considerable oxidative stress associated with acute and chronic inflammation. Although inflammation and ischemia play a key role in producing oxygen-derived free radicals in the digestive tract, the contribution of other factors, such as transition metal imbalances, lipid and glucose metabolic disturbance, and the interaction with gaseous molecules including nitric oxide and carbon monoxide, has also been suggested. Recent studies have demonstrated that several biomarkers indicating oxidative stress-mediated damage may help in monitoring the degree of disease and planning the design of new therapeutic strategies. In addition, recent advances in 'omics' research (genomics, proteomics, metabolomics, etc.) may bring a breakthrough in the field of gastroenterology and hepatology: Several molecular targets for oxidative stress have been presented by the 'omics'. The fourth volume of the Wonders of the Human Body series dives deep into why our bodies need energy and how we get it. As with all our explorations into the complexity of the human body, when you see the incredible design of the digestive system, you ultimately have to ask yourself, "Can this all possibly be an accident? Something that happened by chance?" The answer is a resounding, "No!" We are not the product of evolution. We are not animals. We are a special creation. In Digestive System & Metabolism, you will learn about: The digestive system—including the teeth and tongue, the mouth and esophagus, the stomach and intestines, the liver, the gallbladder, and the pancreas Our metabolism—a complex system created by God to transform food into fuel for our energy God our Designer thought of everything, even the problems that would occur in a sin-cursed world. We are indeed wonderfully made. Prepare to be amazed!

The human digestive system plays an important role in processing food in order to provide nutrients that the body can use. This well-illustrated text presents the basics of anatomy, physiology and disease of the human digestive system by answering a series of questions relevant to the various components of this system. For example, in studying the stomach, the following questions are examined: 1) Where is the stomach located? 2) What does the stomach look like? 3) What does the stomach do? 4) Where do gastric juices come from? 5) What causes ulcers? 6) What causes a stomach ache? and 7) What causes burping? Additionally, most chapters are filled with unusual trivia related to the part of the body being discussed. For example, there was a 42-year-old woman who complained of mild abdominal pain and had 2533 objects removed from her stomach, including 947 pins. The text provides a fun and interesting way to learn more about the digestive system. The text is ideal, whether you are looking for an entertaining and informative read on the workings of the human digestive tract or looking for a text or resource for biology or health classes.

Human anatomy can be an easy enough subject with age appropriate resources. This ebook is ideal for fourth graders because of the choice of words and subject matter. In it, you will learn about the nervous, immune and digestive systems. Learn to categorize the organs depending on the organ system that they belong to. Grab a copy today.

Increased and combined knowledge of food processing, molecular biology, health and nutrition has triggered production of many different types of functional foods and pharmaceuticals recently. The efficacy and safety of such products are being assessed prior to marketing by *in vivo* and/or *in vitro* studies. Traditional *in vivo* studies require excessive time, cost and labour, as well as ethical approvals with subject to humans or animals in some instances. Therefore excessive number of runs may be avoided if reliable *in vitro* system is available. During the course of this study, an *in vitro* physicochemical upper gastrointestinal tract system (IPUGS), the first of its kind in literature, has been developed to simulate the relevant conditions of the gastrointestinal tract (GIT) as closely as possible to the human physiology with multi-disciplinary approach, combining biology, physiology, gastroenterology, process technology, chemical engineering and automation. The IPUGS is aimed at having a high predictive capability towards the real digestion processes occurring in the human upper GIT which allows for examining of the bioavailability of nutrients and drugs, drug-nutrient interactions, viability of probiotics and case studies of gastrointestinal disorders. Digestion of rice and baby foods have been studied with the IPUGS by UV-spectrophotometer, HPLC, light microscope and pH meter under the conditions of normal state and common gastric disorders, such as gastroparesis, dumping

syndrome, Zollinger-Ellison syndrome and hypochlorhydria. By comparing the data from many physiological and clinical sources in the literature, it would seem that the IPUGS was able to generate more reliable data compared to the existing in vitro digestion (mechanical) models in the literature. In future, computer-controlled and computer-recorded data by possibly designing a new software or equations would be desirable to implicate a better understanding of the digestive processes.
